NEW Quiedan 4000 Series Greenhouses

Single-Span Greenhouse

Single span greenhouse with its many options is ideal for crops such as berries, asparagus, and broccoli. It is an excellent way to control variability, which results in better quality and an extended growing season. On average two or three weeks earlier and later harvests are possible when compared to growing without a greenhouse. Longer harvest windows and higher quality means more value from crops.

Multi-Span Greenhouse

Quiedan's multi-span greenhouses maximize the land area covered with structures. The multi-spans can cover irregular sites that may be either concave or convex as well as their stair-stepped topographies, while maximizing the space between houses.

The greenhouses also easily accommodate other equipment such as shading structures, thermal screens, cooling-pad fans, high pressure fog systems, ventilation, heating systems and more.

The 4000 series greenhouse helps to maximize the utility of your land through its elegant and effective design.

Providing protection and extending growing seasons leads to a higher quality and greater quantity of crops produced.

The strong design and high quality anti-corrosion materials means your 4000 series greenhouse will last for years to come, while maintaining the advantages of a temporary structure.

The simple design allows for faster construction, which means you'll be growing in your new 4000 series greenhouse in no time.

Modular parts means the 4000 series greenhouse can easily be adapted to fit your available space, growing needs, and budget.

Modular also means upgrades and new additions can easily be made to existing structures.

Your greenhouse and its systems can grow with you.

AS NOTED

The rolling vent system is one example of several possible add-ons for the 4000 series. The rolling vents allow for passive venting while keeping pests out. Simple and effective, it gives you greater control over the growing conditions of your crops.

Other popular add-ons include the auto screen system, for shading crops from inside or outside the greenhouse, and the Pad-Fan system, for cooling and creating an optimal growing environment.
